

OBJECT-ORIENTED LANGUAGE AND THEORY

8. POLYMORPHISM

Nguyen Thi Thu Trang
trangntt@soict.hust.edu.vn

Outline

1. Upcasting and Downcasting
2. Static and dynamic bindings
3. Polymorphism
4. Generic programming

Primitive data

- Upcasting:
 - small to big range
 - implicitly cast
 - e.g. byte => short => int => double
 - byte b = 2;
 - short s = b;
- Downcasting
 - big to small
 - explicitly cast
 - e.g. int => short
 - (short)

Object/Class

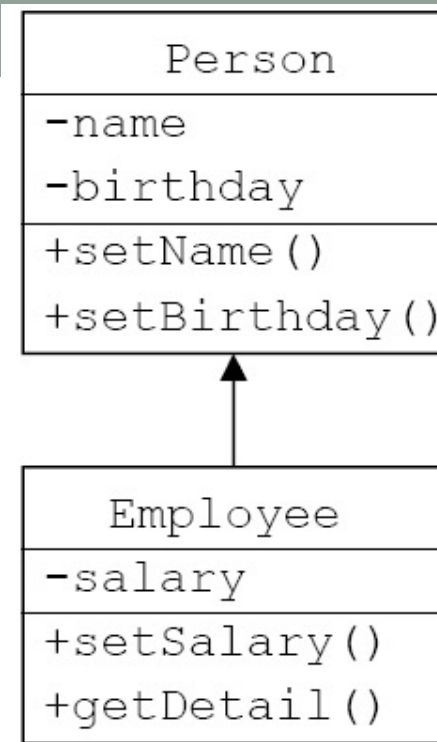

- Parent and child: Child is a kind of Parent
- If parent is smaller: Person and Employee
 - Parent is always a child
 - Child is not always a parent
- **If child is smaller => TRUE**
 - Employee is always a person
 - Person is not always an employee

1.1. Upcasting

- Moving up the inheritance hierarchy
- Up casting is the capacity to view an object of a derived class as an object of its base class.
- Automatic type conversion (implicitly)

Example

```
public class Test1 {  
    public static void main(String arg[]){  
        Person p;  
        Employee e = new Employee();  
        p = e; //upcasting  
        p.setName("Hoa");  
        p.setSalary(350000); // compile error  
  
        Employee e1 = (Employee) p; //downcasting  
        e1.setSalary(350000); //ok  
    }  
}
```

Example (2)

```
class Manager extends Employee {  
    Employee assistant;  
    // ...  
    public void setAssistant(Employee e) {  
        assistant = e;  
    }  
    // ...  
}  
  
public class Test2 {  
    public static void main(String arg[]){  
        Manager junior, senior;  
        // ...  
        senior.setAssistant(junior);  
    }  
}
```

Example (3)

```
public class Test3 {  
    String static teamInfo(Person p1, Person p2) {  
        return "Leader: " + p1.getName() +  
            ", member: " + p2.getName();  
    }  
  
    public static void main(String arg[]) {  
        Employee e1, e2;  
        Manager m1, m2;  
        // ...  
        System.out.println(teamInfo(e1, e2));  
        System.out.println(teamInfo(m1, m2));  
        System.out.println(teamInfo(m1, e2));  
    }  
}
```

1.2. Downcasting

- Move back down the inheritance hierarchy
- Down casting is the capacity to view an object of a base class as an object of its derived class.
- Does not convert types automatically
 - Must cast types explicitly.

Example

```
public class Test2 {  
    public static void main(String arg[]){  
        Employee e = new Employee();  
        Person p = e; // up casting  
        Employee ee = (Employee) p; // down casting  
        Manager m = (Manager) ee; // run-time error  
  
        Person p2 = new Manager();  
        Employee e2 = (Employee) p2;  
    }  
}
```

Outline

1. Upcasting and Downcasting
- ➔ 2. Static and dynamic bindings
3. Polymorphism
4. Generic programming

Function call binding

- Function call binding is a procedure to **specify the piece of code that need to be executed** when calling a function
- E.g. C language: a function has a unique name

OOP languages (method call binding)

- For independent classes (are not in any inheritance tree), the procedure is almost the same as function call binding
 - Compare function name, argument list to find the corresponding definition

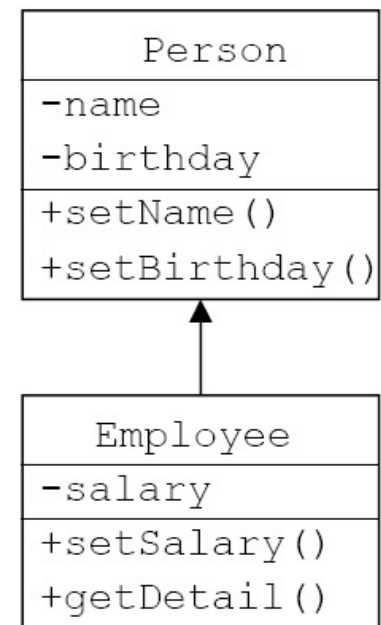

2.1. Static Binding

- Binding at the compiling time
 - Early Binding/Compile-time Binding
 - Function call is done when compiling, hence there is only one instance of the function
 - Any error will cause a compiling error
 - Advantage of speed
- C/C++ function call binding, and C++ method binding are basically examples of static function call binding

Example

```
public class Test {  
    public static void main(String arg[]){  
        Person p = new Person();  
        p.setName("Hoa");  
        p.setSalary(350000); //compile-time error  
    }  
}
```

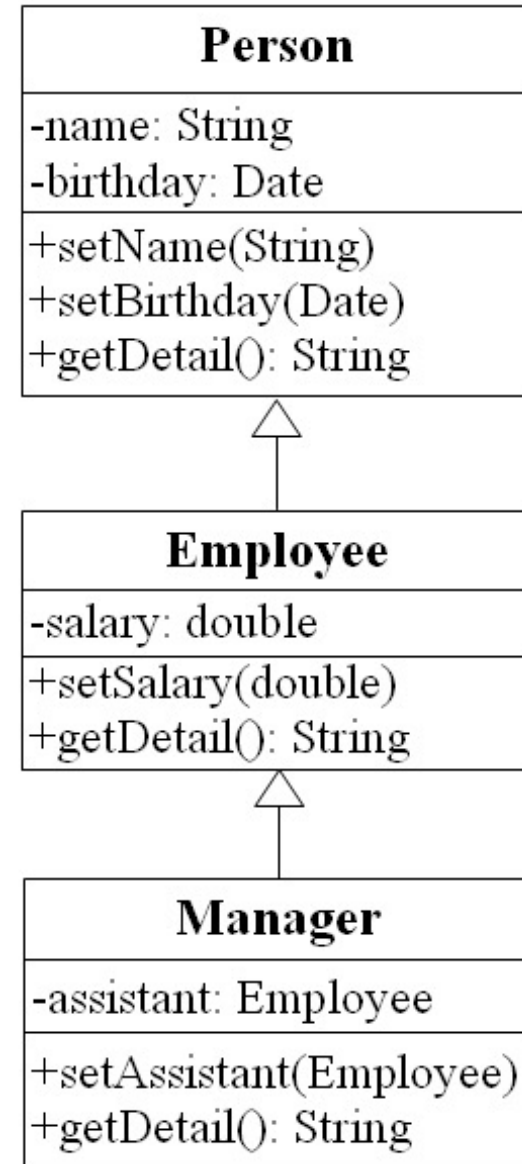

2.2. Dynamic binding

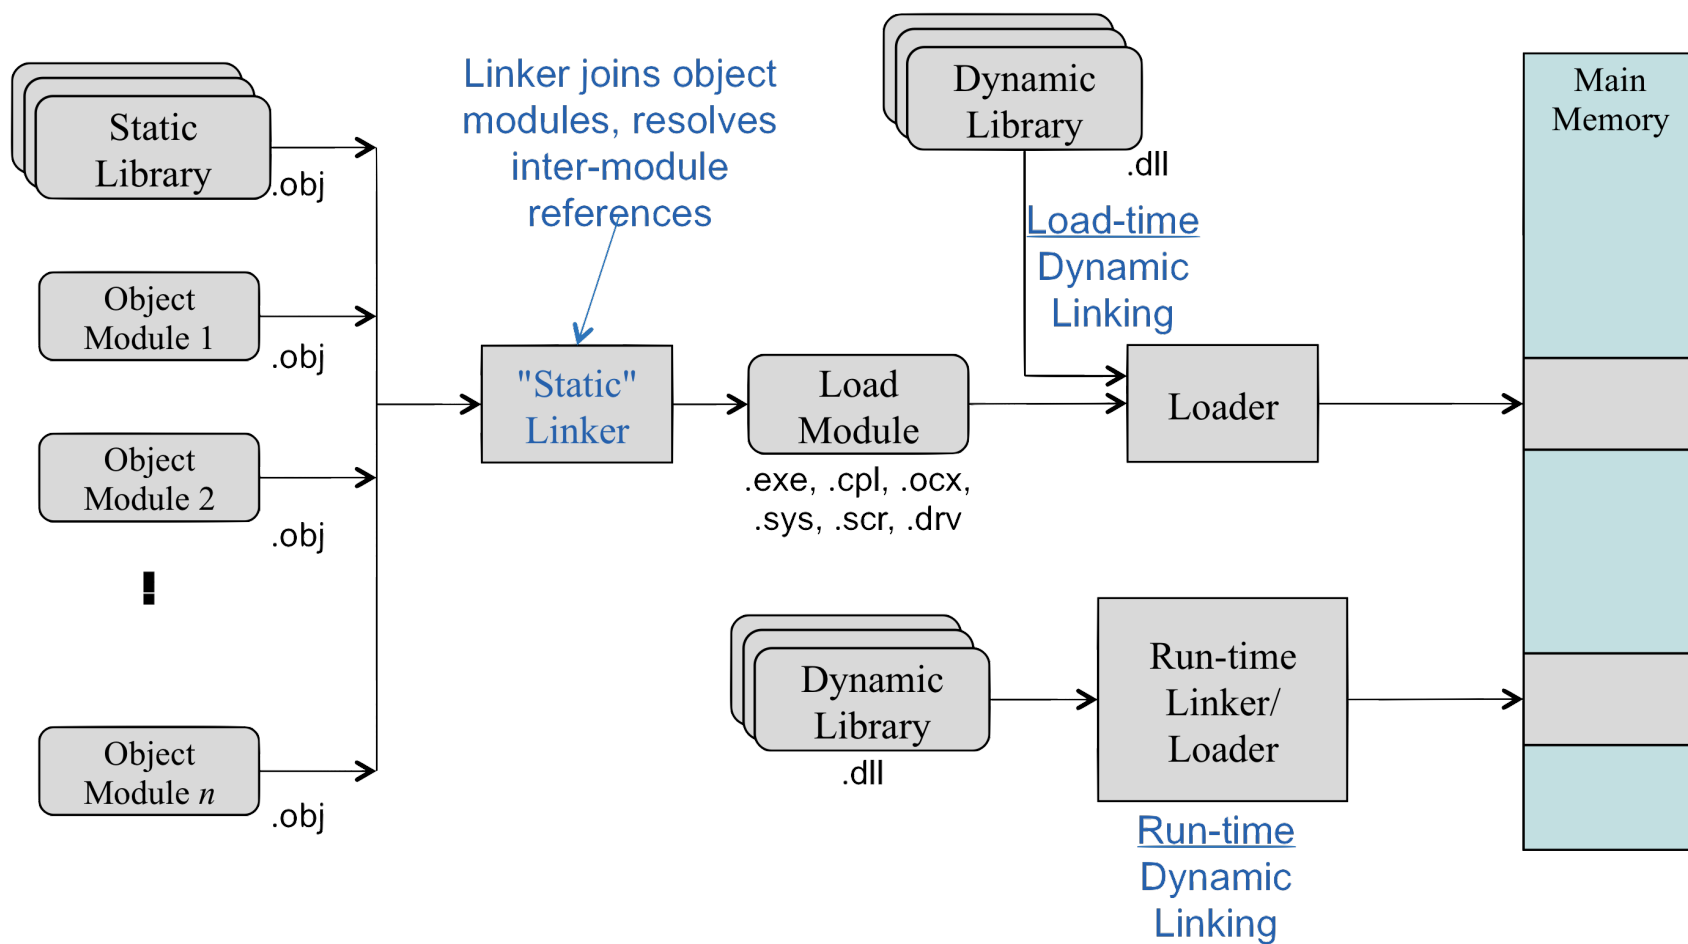

- The method call is done at run-time
 - Late binding/Run-time binding
 - Instance of method is suitable for called object.
 - Java uses dynamic binding by default

Example

```
public class Test {
    public static void main(String arg[]) {
        Person p = new Person();
        // ...
        Employee e = new Employee();
        // ...
        Manager m = new Manager();
        // ...
        Person pArr[] = {p, e, m}; //upcasting
        for (int i=0; i< pArr.length; i++){
            System.out.println(
                pArr[i].getDetail());
        }
    }
}
```

Linker and Loader

Outline

1. Upcasting and Downcasting
2. Static and dynamic bindings
- 3. Polymorphism
4. Generic programming

3. Polymorphism

- Polymorphism: multiple ways of performance, of existence
- Polymorphism in OOP
 - Method polymorphism:
 - Methods with the same name, only difference in argument lists => method overloading
 - Object polymorphism
 - **Multiple types:** A single object to represent multiple different types (upcasting and downcasting)
 - **Multiple implementations/behaviors:** A single interface to objects of different types (upcasting+overriding – dynamic binding)

3. Polymorphism (2)

- A single symbol to represent multiple different types
→ Upcasting and Downcasting

```
public class Test3 {
    public static void main(String args[]) {
        Person p1 = new Employee();
        Person p2 = new Manager();

        Employee e = (Employee) p1;
        Manager m = (Manager) p2;
    }
}
```

3. Polymorphism (5)

- A single interface to entities of different types
→ Dynamic binding (Java)

- Example:

```
Person p1 = new Person();  
Person p2 = new Employee();  
Person p3 = new Manager();  
// ...  
System.out.println(p1.getDetail());  
System.out.println(p2.getDetail());  
System.out.println(p3.getDetail());
```

Why Polymorphism?

- The ability to hide many different implementations behind a single interface

- interface TVInterface {
 - public void turnOn();
 - public void volumnUp(int steps);
 - ...
- }
- class TVA implements TVInterface {
 - public void turnOn() { ... }
 - ...
- }
- class TVB implements TVInterface {...}
- class TVC implements TVInterface {...}
- class RemoteControl {
 - TVInterface tva = new TVA(); tva.turnOn(); tva.volumnUp(2);
 - TVInterface tvb = new TVB(); tvb.turnOn(); tvb.volumnUp(2);
 - TVInterface tvc = new TVC(); tvc.turnOn(); tvc.volumnUp(2);
- }

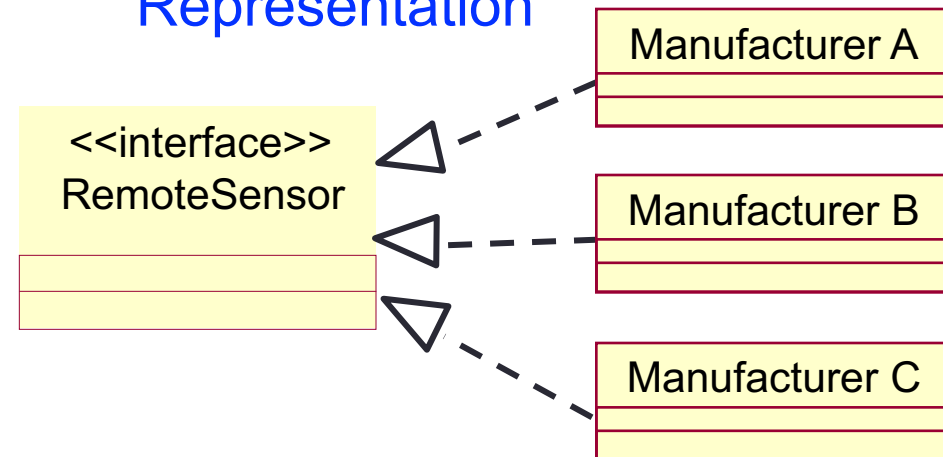

What Is an Interface?

- A declaration of a coherent set of public features and obligations
 - A contract between providers and consumers of services

Elided/Iconic
Representation
("ball")

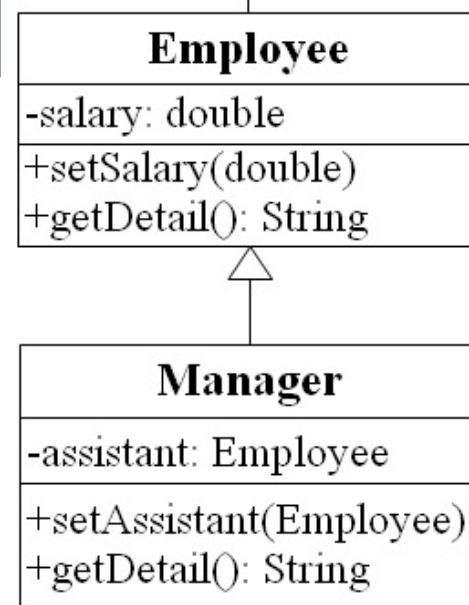

Canonical
(Class/Stereotype)
Representation

Other examples

```
class EmployeeList {
    Employee list[];
    ...
    public void add(Employee e) {...}
    public void print() {
        for (int i=0; i<list.length; i++) {
            System.out.println(list[i].getDetail());
        }
    }
}

...
EmployeeList list = new EmployeeList();
Employee e1; Manager m1;
...
list.add(e1); list.add(m1);
list.print();
```

Operator instanceof

```
public class Employee extends Person {}  
public class Student extends Person {}  
  
public class Test{  
    public doSomething(Person e) {  
        if (e instanceof Employee) {...  
        } else if (e instanceof Student) {... }  
        } else {...}  
    }  
}
```

Outline

1. Upcasting and Downcasting
2. Static and dynamic bindings
3. Polymorphism
- 4. Generic programming

4. Generic programming

- Generalizing program so that it can work with different data types, including some future data types
 - Algorithm is already defined
- Example:
 - C: using pointer void
 - C++: using template
 - Java: take advantage of upcasting
 - Java 1.5: Template

Example: C using void pointer

- Malloc function:

```
void* memcpy(void* region1,  
             const void* region2, size_t n){  
    const char* first = (const char*)region2;  
    const char* last = ((const char*)region2) + n;  
    char* result = (char*)region1;  
    while (first != last)  
        *result++ = *first++;  
    return result;  
}
```

Example: C++ using template

When using, we can replace ItemType by int, string,... or any object of any class

```
template<class ItemType>
void sort(ItemType A[], int count ) {
    // Sort count items in the array, A, into increasing order
    // The algorithm that is used here is selection sort
    for (int i = count-1; i > 0; i--) {
        int index_of_max = 0;
        for (int j = 1; j <= i ; j++)
            if (A[j] > A[index_of_max]) index_of_max = j;
        if (index_of_max != i) {
            ItemType temp = A[i];
            A[i] = A[index_of_max];
            A[index_of_max ] = temp;
        }
    }
}
```

Example: Java using upcasting and Object

```
class MyStack {  
    ...  
    public void push(Object obj) {...}  
    public Object pop() {...}  
}  
  
public class TestStack{  
    MyStack s = new MyStack();  
    Point p = new Point();  
    Circle c = new Circle();  
    s.push(p); s.push(c); //upcasting  
    Circle c1 = (Circle) s.pop(); //downcasting  
    Point p1 = (Point) s.pop(); //downcasting  
}
```

Recall – equals

```
class MyValue {  
    private int number;  
    public MyValue(int number){this.number = number;}  
    public boolean equals(Object obj){  
  
    }  
    public int getNumber(){return number;}  
}  
  
public class EqualsMethod2 {  
    public static void main(String[] args) {  
        MyValue v1 = new MyValue(100);  
        MyValue v2 = new MyValue(100);  
        System.out.println(v1.equals(v2));  
        System.out.println(v1==v2);  
    }  
}
```

Exercise

- Re-write method **equals** for the class **MyValue** (this method is inherited from the class Object)

```
class MyValue {  
    int i;  
    public boolean equals(Object obj) {  
        return (this.i == ((MyValue) obj).i);  
    }  
}  
  
public class EqualsMethod2 {  
    public static void main(String[] args) {  
        MyValue v1 = new MyValue();  
        MyValue v2 = new MyValue();  
        v1.i = v2.i = 100;  
        System.out.println(v1.equals(v2));  
        System.out.println(v1==v2);  
    }  
}
```

Example: Java 1.5: Template

- Without Template

```

List myList = new LinkedList();
myList.add(new Integer(0));
Integer x = (Integer)
    myList.iterator().next();
  
```

Example: Java 1.5: Template (2)

- Using Template:

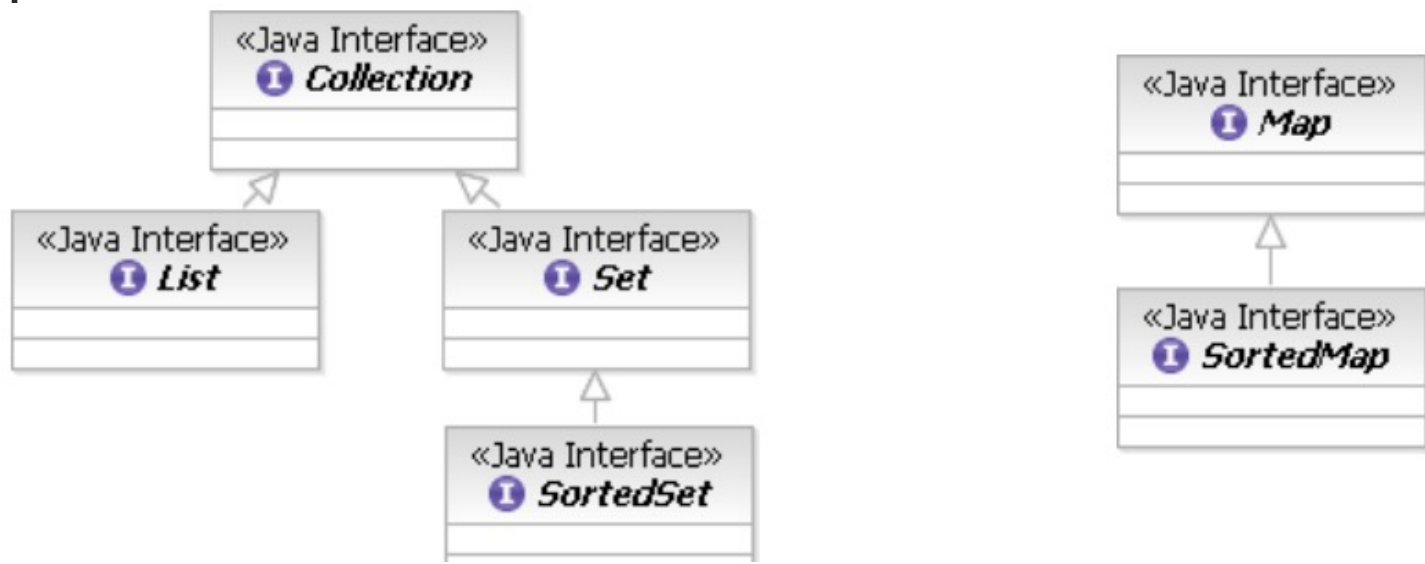

```
List<Integer> myList = new LinkedList<Integer>();  
myList.add(new Integer(0));  
Integer x = myList.iterator().next();
```

//myList.add(new Long(0)); → Compile error

4.1. Java generic data structure

- Collection: a collection of objects
 - List: a collection of objects that are sequential, consecutive and repeatable
 - Set: a collection of objects that are not repeatable
- Map: Collection of key-value pairs (key is unique)
 - Linking objects in this set to other sets as a dictionary/a telephone book.

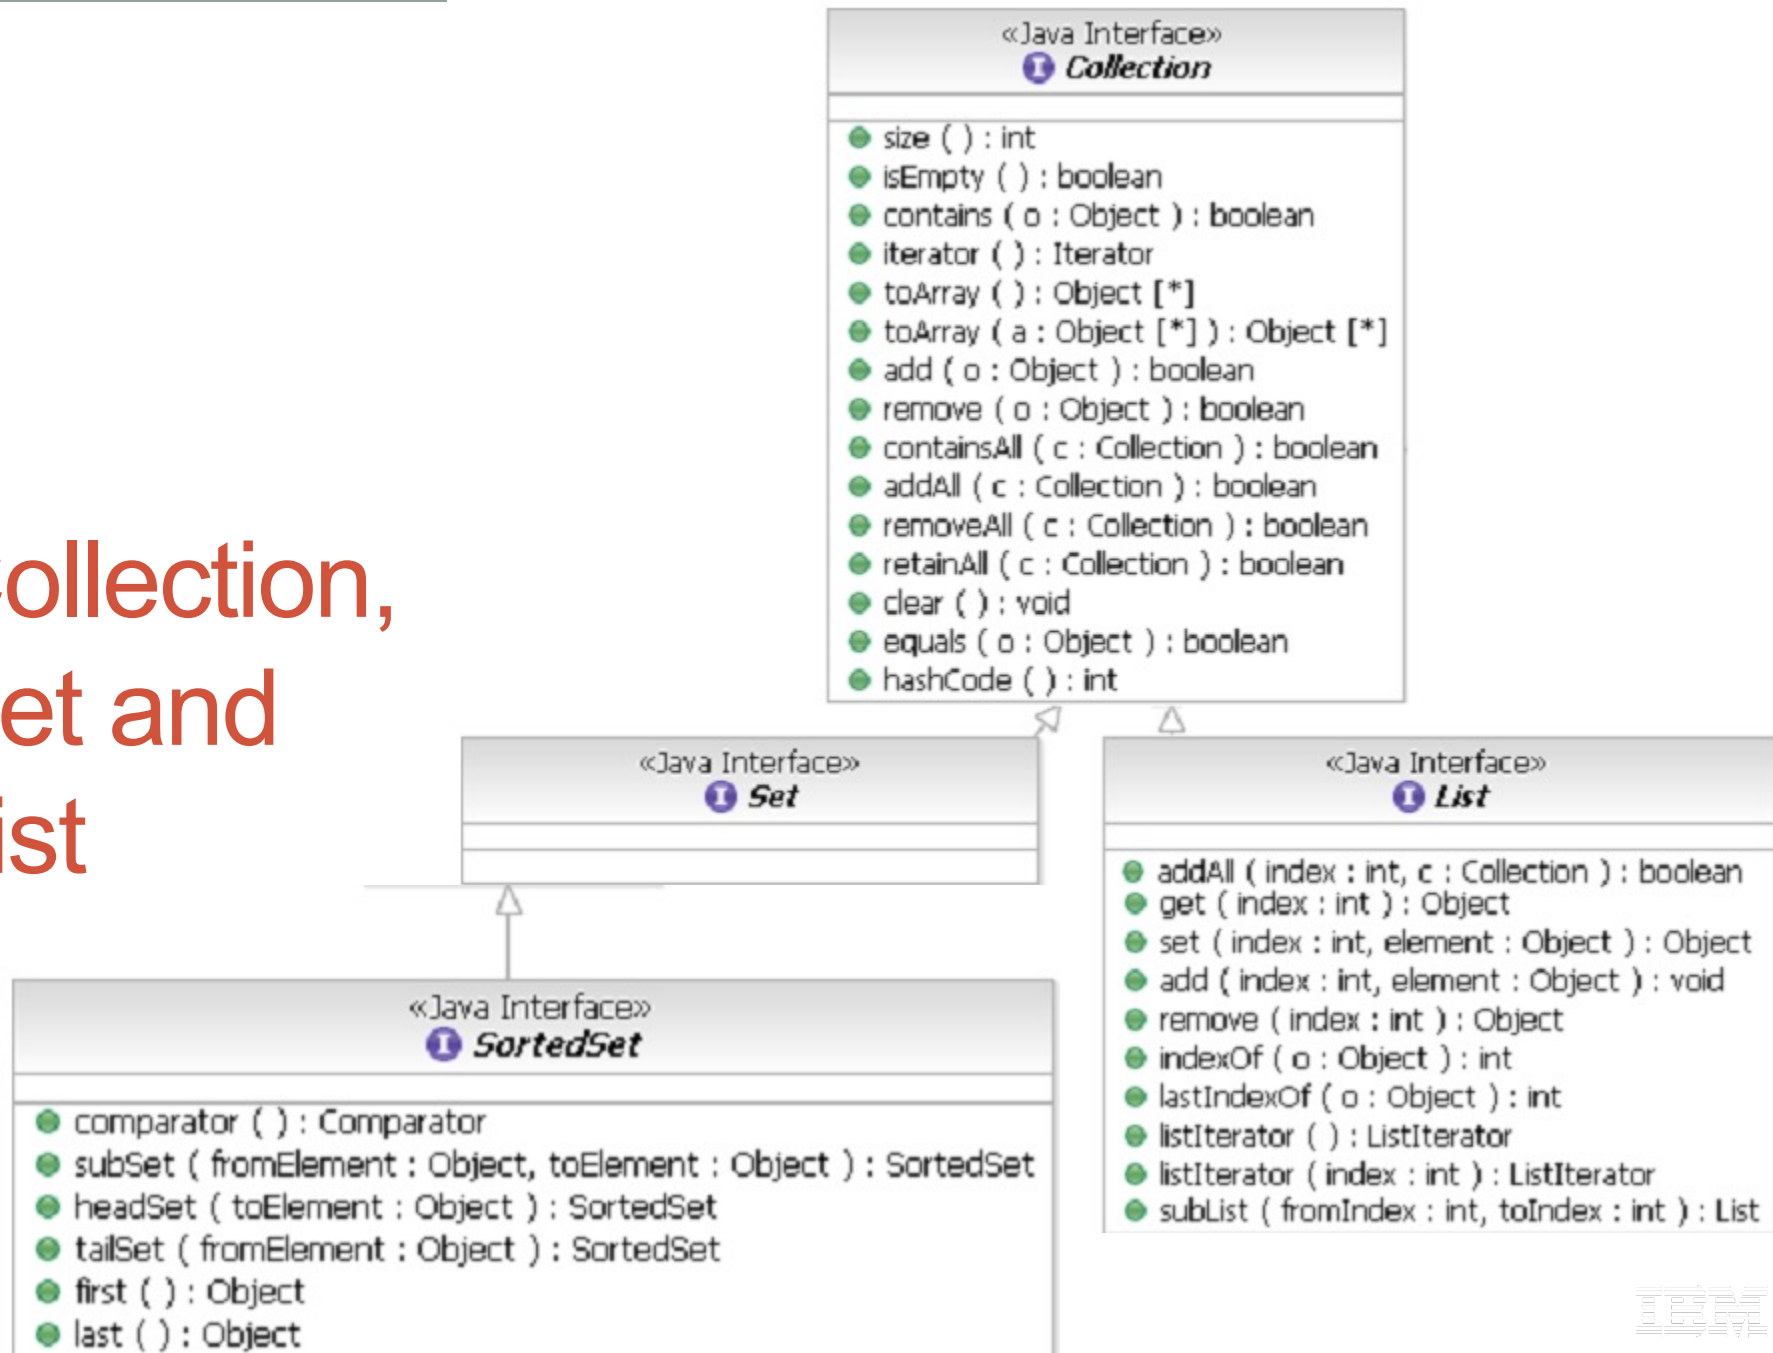

a. Interface of Collection

- Specifies basic interface for manipulating a set of objects
 - Add to collection
 - Remove from collection
 - Check if existing
- Contains methods to manipulate individual objects or a set of objects
- Provide methods to traverse objects in a repeatable collection and convert a collection to an array

«Java Interface»  <i>Collection</i>	
	size () : int
	isEmpty () : boolean
	contains (o : Object) : boolean
	iterator () : Iterator
	toArray () : Object [*]
	toArray (a : Object [*]) : Object [*]
	add (o : Object) : boolean
	remove (o : Object) : boolean
	containsAll (c : Collection) : boolean
	addAll (c : Collection) : boolean
	removeAll (c : Collection) : boolean
	retainAll (c : Collection) : boolean
	clear () : void
	equals (o : Object) : boolean
	hashCode () : int

Collection, Set and List

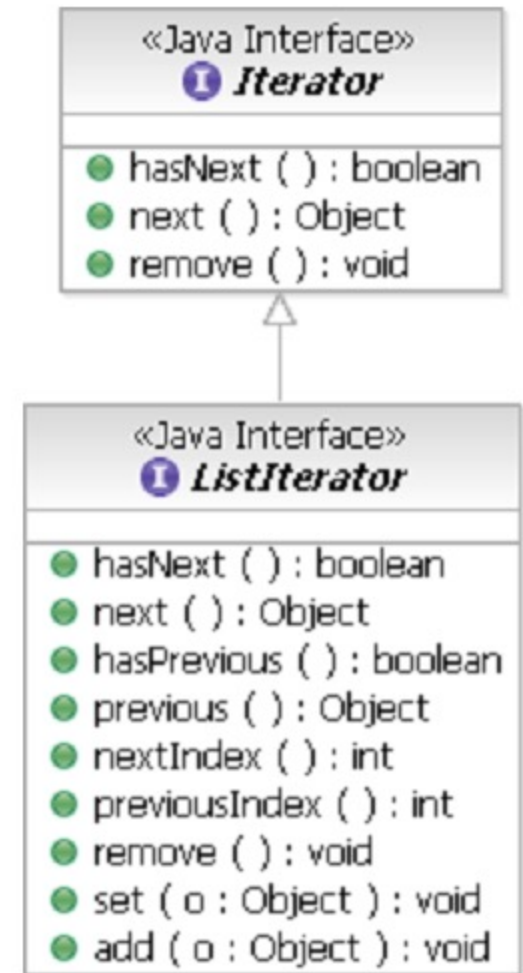

b. Interface of Map

- A basic interface for manipulating a set of pairs key-value
 - Add a pair key-value
 - Remove a pair key-value
 - Get a value of a given key
 - Check if existing
(key or value)
- 3 views for the content of collections:
 - Key collection
 - Value collection
 - Mapping collection of key-value

c. Iterator

- Provide a mechanism to visit (repeat) all the members of a collection
 - Similar to SQL cursor
- ListIterator has methods to show the sequential attribute of the basic list
- Iterator of a sorted collection will visit in the sorting order

Source code for Iterator

```
Collection c;  
// Some code to build the collection  
  
Iterator i = c.iterator();  
while (i.hasNext()) {  
    Object o = i.next();  
    // Process this object  
}
```

Interface and Implementation

- `Set<String> mySet = new TreeSet<String>();`
- `Map<String,Integer> myMap = new HashMap<String,Integer>();`

		IMPLEMENTATIONS				
		Hash Table	Resizable Array	Balanced Tree	Linked List	Legacy
I N T E R F A C E S	Set	HashSet		TreeSet		
	List		ArrayList		LinkedList	Vector, Stack
	Map	HashMap		TreeMap		HashTable, Properties

```
public static void main(String args[]) {  
    Map map<String,Integer> = new HashMap<String,Integer>();  
    Integer ONE = new Integer(1);  
    for (int i=0, n=args.length; i<n; i++) {  
        String key = args[i];  
        Integer frequency = map.get(key);  
        if (frequency == null) { frequency = ONE; }  
        else {  
            int value = frequency.intValue();  
            frequency = new Integer(value + 1);  
        }  
        map.put(key, frequency);  
    }  
    System.out.println(map);  
    Map sortedMap = new TreeMap(map);  
    System.out.println(sortedMap);  
}
```

{

4.2. Defining and using Template

```
class MyStack<T> {  
    ...  
    public void push(T x) {...}  
    public T pop() {  
        ...  
    }  
}
```

Using template

```
public class Test {  
    public static void main(String args[]) {  
  
        MyStack<Integer> s1 = new MyStack<Integer>();  
        s1.push(new Integer(0));  
        Integer x = s1.pop();  
  
        //s1.push(new Long(0)); → Error  
  
        MyStack<Long> s2 = new MyStack<Long>();  
        s2.push(new Long(0));  
        Long y = s2.pop();  
  
    }  
}
```

Defining Iterator

```
public interface List<E>{  
    void add(E x);  
    Iterator<E> iterator();  
}
```

```
public interface Iterator<E>{  
    E next();  
    boolean hasNext();  
}
```

```
class LinkedList<E> implements List<E> {  
    // implementation  
}
```

4.3. Wildcard

```
public class Test {  
    public static void main(String args[]) {  
        List<String> lst0 = new LinkedList<String>();  
        //List<Object> lst1 = lst0; → Error  
        //printList(lst0); → Error  
    }  
  
    void printList(List<Object> lst) {  
        Iterator it = lst.iterator();  
        while (it.hasNext())  
            System.out.println(it.next());  
    }  
}
```

Example: Using Wildcards

```
public class Test {  
    void printList(List<?> lst) {  
        Iterator it = lst.iterator();  
        while (it.hasNext())  
            System.out.println(it.next());  
    }  
  
    public static void main(String args[]) {  
        List<String> lst0 =  
            new LinkedList<String>();  
        List<Employee> lst1 =  
            new LinkedList<Employee>();  
  
        printList(lst0);    // String  
        printList(lst1);    // Employee  
    }  
}
```

Wildcards of Java 1.5

- "? extends Type": Specifies a set of children types of Type. This is the most useful wildcard.
- "? super Type": Specifies a set of parent types of Type
- "?": Specifies all the types or any types.

Example of wildcard (1)

```
public void printCollection(Collection c) {  
    Iterator i = c.iterator();  
    for(int k = 0;k<c.size();k++) {  
        System.out.println(i.next());  
    }  
}
```

→ Using wildcard:

```
void printCollection(Collection<?> c) {  
    for(Object o:c) {  
        System.out.println(o);  
    }  
}
```

Example of wildcard (2)

```
public void draw(List<Shape> shape) {  
    for(Shape s: shape) {  
        s.draw(this);  
    }  
}
```

→ What is the difference compared with:

```
public void draw(List<? extends Shape> shape) {  
    // rest of the code is the same  
}
```

Template Java 1.5 vs. C++

- Template in Java does not create new classes
- Check the consistency of types when compiling
 - All the objects are basically of the type Object

Function call vs. Message passing

- Call function
 - Indicate the exact piece of code to be executed.
 - Has only an execution of a function with some specific name.
 - There are no functions with the same name
- Message passing
 - **Request a service from an object and the object will decide what to do**
 - **Different objects will have different reactions/behaviors for a message.**

Message vs. Method

- Message
 - Is sent from an object to another object and does not contain any piece of code to be executed
- Method
 - Method/function in structure programming languages
 - Is an execution of service that is requested in the message
 - Is a piece of code to be executed in order to respond to a message sent to an object
